

PERFORMANCE REPORT

A consolidated view of scheduler efficiency, resource utilization, and workload throughput across the simulated cluster.

Utilization Trend Over Time

## CONCLUSION

## Simulation Summary

---

**Key takeaway: the Round Robin scheduler sustained 67.4% average CPU and 89.4% average memory utilization while clearing 66 of 112 virtual machines.**

The simulation completed successfully over **100** ticks using the **Round Robin** scheduler. A total of **112** virtual machines were processed across **3** compute hosts. The average CPU utilization was **67.43%**, average memory utilization was **89.37%**, and the average VM waiting time was **3.88 ticks**. The peak waiting queue observed during the simulation was **33** virtual machines.
